Now, what I want to do is that I want to keep track of last entered and last deleted entries, so that if I enter the application, the last entry entered should be kept. Please let me know how can I achieve this? A: "Save" or "add to" are not the right terms. You should be saving your changes, using either INSERT or UPDATE. What you are looking for is the last_insert_rowid() method. You can use that in your DAO classes to figure out what was added, and then simply use the rowid that came back to determine if the "last" item was added, or what is last rowid that was modified. 2d92ce491b
