MG and MG authors have different writing methods. MG authors are more focused on the characters and story.Q: Where is the log file created by `self.send_output_file`? I want to create a log file for my Flask app, so I have followed the instruction from the official docs. import logging import sys logging.basicConfig(filename="./log.txt", level=logging.DEBUG) class DebuggedServer(wsgi.RequestHandler): def __init__(self): logging.debug("Starting server") logging.info("Server started") self.send_error(404, "This is a sample error") self.send_response(200) self.send_response(407) self.send_response(403) self.send_response(500) self.send_response(404) self.send_error(404, "This is a sample error") self.send_error(404, "This is a sample error") self.send_error(404, "This is a sample error") self.send_error(404, "This is a sample error") if __name__ == "__main__": app = wsgi.Application(app=DebuggedServer, environ={ "WSGI_HANDLER": "example.app.application", }) app.run(debug=True) I have found that the log file is created. But where? According to the docs, it should be created in the same directory as app.py, but I can't find the log.txt. 2d92ce491b
